1. Project Title: Lead institution for Achanakmar-Amarkantak Biosphere Reserve, Chhattisgarh.

Project ID NO. 102/TFRI/2006/ Ento-I(MoEF) (12)

2. Duration of the Project: 3 Years (from June 2006- 31st May 2009)

3. Funding source: Ministry of Environment and Forests, Government of India.

4. Cost of Project: Sanctioned =Rs. 12,79,500.00
Amount Released =Rs. 10, 45,344.00
Expenditure = Rs. 10,42,506.00

5. Name of PI & Associate:

Dr. K.C.Joshi, Scientist G, Group Co-ordinator (Research)
Dr. Ruby Sharma, Research Associate (w.e.f. Nov. 2006 - May 2009)
Ms. Prashansa Muley, Project Assistant (w.e.f. Aug.2006- Oct.2007)
Ms. Sheela Patel, Project Assistant (w.e.f. Dec. 2007-Aug.2008)
Ms. Sita Jamra, Project Assistant (w.e.f. Dec.2008 - April 2009)

6. Objectives:

- Collection, synthesis and dissemination of research based information in respect of Biosphere Reserve from all sources.
- Interaction with regional research organizations for development of suitable research projects.
- Undertake research and develop data bank.
- Maintain regular interface with the Biosphere Reserve managers to assess the research needs and crucial areas requiring research efforts and providing research inputs for inclusion in Management Action Plan..
- Publication of a compendium of upto date information and bringing biannual publications aimed at educating stakeholders.
- Preparation of project document for designation of new BRs in coordination with concern State Government.
- Formulation of project proposals for designation of Indian Biosphere Reserves on World Network of BR recognized by UNESCO.
- Any other assignments which may be entrusted by Central Government to achieve the larger objectives of the scheme.

7. Physical Targets:

- Collection and Synthesis of information.
- Interaction with regional research organizations.
- Undertake research and develop data bank.
- Maintain regular Interface with BR managers to assess research needs.
- Publication of compendium of up to date information and bringing out bi-annual publications aimed at educating stakeholders.
- Formulation of project proposals (nomination report) for designation of Biosphere Reserve on World Network of BRs recognized by UNESCO.

8. Achievement of Physical Targets:

I. Collection and Synthesis of information:

In all, 75 references on Achanakmar-Amarkantak BR were collected and the information gathered compiled in two issues of Biosphere Information Series. Data on population of inhabitants in BR collected as per census 2001, compiled and kept as data bank. The regeneration status of various flora in core, buffer and transition zones studied.

II. Interaction with regional research organizations:

Scientific Organizations including various universities of M.P., Chhattishgarh and Maharashtra were visited for interaction with scientists and academicians. They were encouraged to submit the research project proposal on Achanakmar- Amarkantak BR to MOEF, Government of India for funding. The following organizations were interacted:

1. Guru Ghasidas University, Bilaspur, (CG)
2. Awadh Pratap Singh University, Rewa (M.P.)
3. Indira Gandhi Agricultural University, Raipur (CG)
4. Jawaharlal Nehru Krishi Vishwa Vidhyalaya, Adhartal, Jabalpur
5. Zoological Survey of India, Central Zone, Jabalpur
6. State Forest Research Institute, Polipather, Jabalpur
7. Tropical Forest Research Institute, Jabalpur
8. Anthropological Society of India, Nagpur
9. School of Studies in Zoology, Jiwaji University, Gwalior, M.P.
10. Jaiv Vividhta avam Adivashi Vikas Anushandhan Network, Jabalpur, (M.P.).

Indira Gandhi Agriculture University Raipur, ZSI, SFRI, TFRI, Anthropological Society of India and Jaiv Vividhta avam Adivashi Vikas Anushandhan Network, Jabalpur, M.P. submitted the projects on various activities in Achanakmar- Amarkantak BR. The funding agency sanctioned financial assistance to Indira Gandhi Agriculture University Raipur, Zoological Survey of India, Jabalpur and Anthropological Society of India, Nagpur.

III. Under took research and developed data bank:

1. Seven sample plots laid out in core and buffer zones to study soil nutrients, soil moisture, and population density of trees, shrubs, herbs and regeneration status.

2. Held a workshop at TFRI Jabalpur on Research needs for Achanakmar-Amarkantak BR and gathered latest information on taxonomically identified species of lichen, ferns and various threats to fauna and flora and various approaches to uplift the economic status of forest dwellers.

3. Compiled village wise population of the inhabitants as per census 2001.

IV. Maintain regular Interface with BR managers to assess research needs

1. Fifteen meetings were held with BR managers at head quarter Bilaspur and with Chief Wildlife Warden level to discuss on different areas of research including zonation of BR.
2. Meetings of State level Steering Committee were also attended to finalise the Management Action Plan and annual action plan of the BR.

V. Publication of compendium of up to date information and bringing bi annual publications aimed at to educate stakeholders:

1. Compendium drafted and submitted to MOEF in January 2007.
2. Two issues of Biosphere information Series published and distributed to stakeholders.
3. An article sent for publication.

VI. Formulation of project proposals for designation of Biosphere Reserve on World Network of BRs recognized by UNESCO

The report prepared and submitted in the second week of March 2009 to State Forest Department of Chhattisgarh for perusal and approval of the draft.

VII. Any other assignment:

1. Madrid Action Plan formulated and submitted to the Ministry of Environment and Forest.
2. Training capsule drafted and submitted to G.B. Pant Institute of Himalayan Environment and Development, Almora.

9. Methodology and experimental layout:

Periodical surveys of different ranges in core, buffer and transition zones of Achanakmar-Amarkantak BR were conducted throughout the project period. Data on geographical areas, natural resources viz. climate, soil, water bodies, fauna available, inhabitants, their population and economic status were taken. Seven sample plots were laid out in both core and buffer zones to study the flora, their density and regeneration status.

Besides this, the information available about various species of the flora and fauna existing in BR, their distribution and status collected. The source of information of each species and abstract of scientific information published in different journals/ volumes were also recorded. The compiled information was edited and published in the form of two issues of Biosphere Reserve Information Series (BRIS) and distributed to BR managers, scientists and academicians of different organizations so that they could have updated information about the BR. Periodical reviews of the project were attended and the comments were incorporated in the project activities.

10. Results and discussion:

I. Collection, synthesis of Research based Information:

Achanakmar - Amarkantak Biosphere Reserve is spread over in a total geographical area of 3835.51 sq kms. It represents the Indo-Malayan realm and Deccan Peninsula biogeographic zone of India and is the first Biosphere Reserve of Chhattisgarh and Madhya Pradesh states. Its boundaries start from Kota and Lormi forest ranges of Bilaspur district (Chhattisgarh) in south to Rajendramgram forest range of Anuppur district Madhya Pradesh in the north and Belghana forest range of Chhattisgarh in the east to Dindori forest range of Dindori district in Madhya Pradesh. It consists of 3 distinct zones viz. core zone, buffer zone, and outer most transition zone (Fig. 1). The core zone starts from Achanakmar range in south (169.133 sq kms.) to Lamni range in north (203.769 sq kms.), and Game range (178.65 sq kms.) on the west. The core zone has 22 villages having a population of 7,617 persons. The buffer and transition zones surround the core zone. The buffer zone is dense forest with a few villages and sub-urban areas like Rajki, Bagdhora and Sarasdol in Chhattisgarh and Jagatpur, Karanjia, Amarkantak, etc. in Madhya Pradesh. The buffer and transition zones have 396 revenue and forest villages and suburban in both the states. Chhattisgarh alone has 225 revenue and forest villages. The inhabitants are poor, mostly tribal, scheduled castes and other backward classes. The population of general category of people is low.

The topography varies from plains of Bilaspur to hilly terrains and valleys. Soil is rich in humus contents, lateritic, alluvial and black cottony. Details of forest ranges, land use, cultural heritage, tourism, etc. have been published in different issues of Biosphere Reserve Information Series (BRIS). It is home to primitive tribal communities like Baiga, Gonds, Panikas, Kol, Dhanaur, besides other communities forming a total population of 4,48,021 persons as per population census 2001. They cultivate agricultural crops and partially depend on BR for food, fodder and medicine.

The climate of BR has 3 distinct seasons viz. monsoon, which begins from July and continues up to October; winter from November to February; and summer from March to June. The lowest temperature in winter is -2 °C, which rises up to a maximum of 46 °C in June. The humidity varies from 39 % to 90%. This climate has enriched a large number of flora and fauna of the BR. The annual rainfall is about 1624.3 mm. A few perennial and many seasonal rivers and a dam called "Khudia dam" also exist in the BR. The forest vegetation is tropical deciduous type and is classified into "Northern Tropical Moist Deciduous and Southern Dry Mixed Deciduous forests (Champion and Seth, 1968).

1. Floral Resources: The forest constitutes 63.91% of the total area of BR. It encompasses rich biodiversity of flora and fauna. The BR consists of a total of 1498 identified floral species viz. 7 species of algae, 178 species of fungi, 130 species of lichens, 16 species of bryophytes, 40 species of pteridophytes, 16 species of gymnosperms and 1111 species of angiosperms with 794 species of dicotyledons and 317 species of monocotyledons. The BR shelters 39 globally threatened floral species (categorized as per IUCN). For the sake of convenience, the vegetation existing in BR can be grouped as hereunder:

A. Algae:

The different algae identified from Chhaparwa and Amarkantak localities of the BR are *Batrachospermum* sp., *Coleochaete* sp., *Chara* sp., *Ulothrix* sp., *Volvox* sp., *Voucheria* sp. and *Zygnuma* sp.

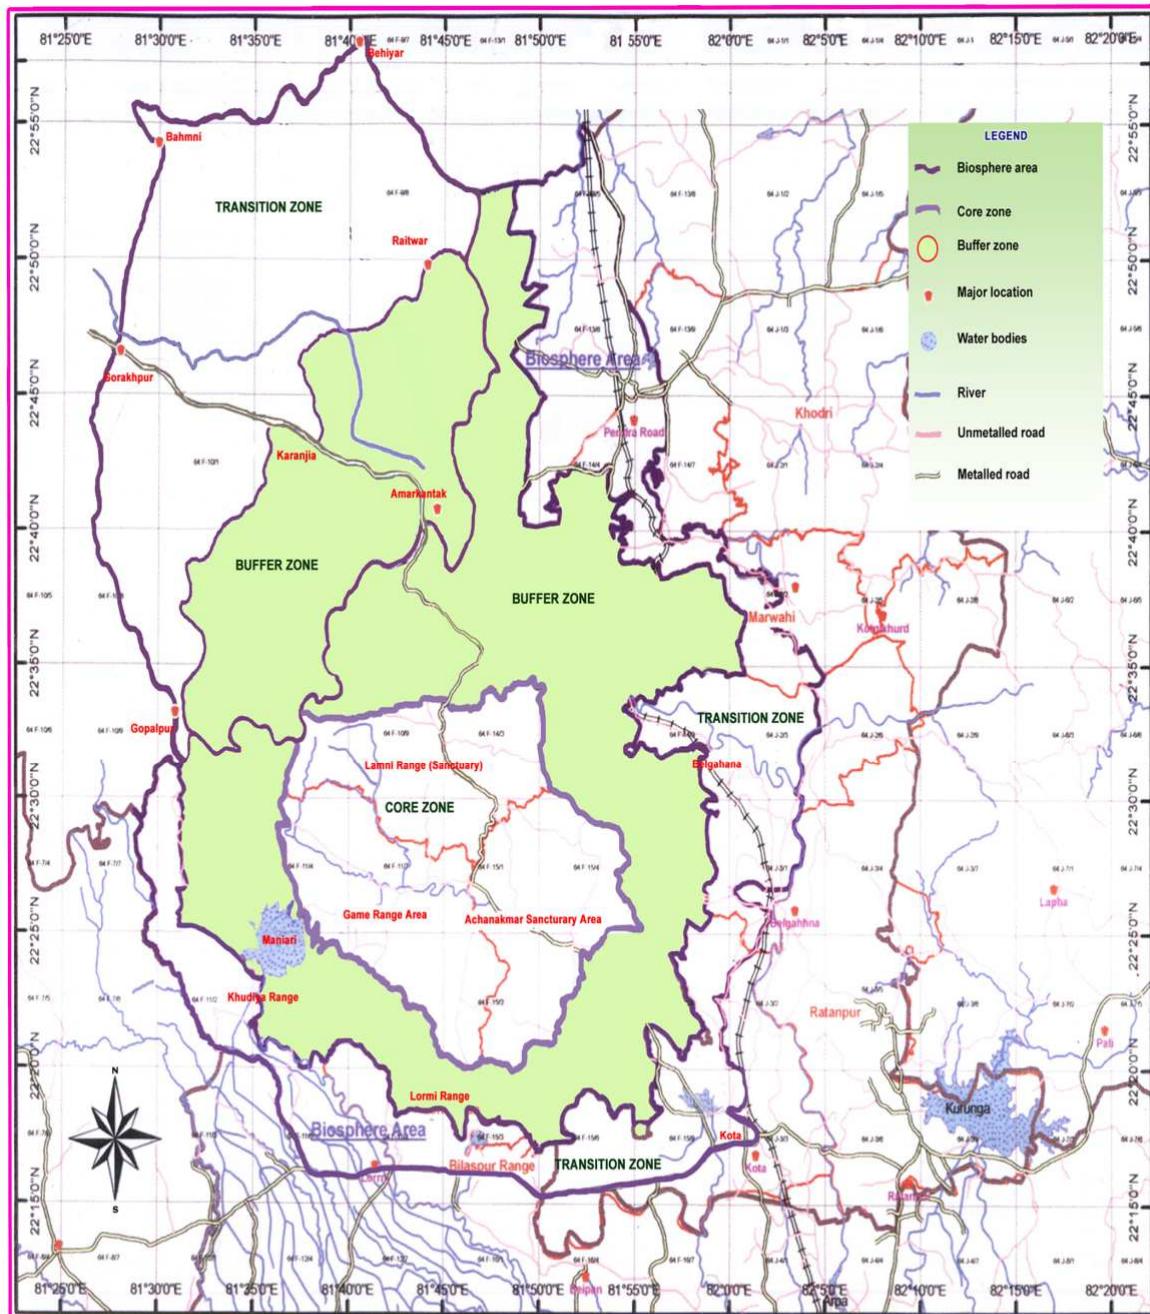

Fig.1. General Location and Zonation Map of Achanakmar - Amarkantak Biosphere Reserve.

B. Fungi:

According to published literature, information on different species of fungi recorded from different localities of BR, their status, etc, is given in the following table.

Table 1. Fungi reported from Achanakmar- Amarkantak BR

Thus, as per the latest knowledge, there are 178 species of fungi representing to 109 genera and 47 families distributed in different zones of Achanakmar- Amarkantak BR.

C. Lichens

In Achanakmar-Amarkantak BR pure sal forest has luxuriant growth of lichens. Before initiation of this project, only 37 species of lichens were known to exist in Achanakmar-Amarkantak BR. The fragmented literature indicated the existence of 93 new species of lichens from Achanakmar-Amarkantak BR resulting in a total of 130 species of 44 lichen genera belonging to 25 families as detailed below:

E. Pteridophytes:

The BR is rich in fern flora and many of them are threatened due to their over exploitation or habitat loss. The following 40 species of pteridophytes belonging to 27 genera under 22 families are reported to exist in the BR.

F. Gymnosperms:

Two species of gymnosperms, namely *Pinus roxburghii* Sarg. and *Thuja orientalis* L. were known to be planted at Amarkantak in 1970. Later, 14 species were introduced in Amarkantak and Lamni

ranges for experimental purposes. At presently, these are following 16 species of gymnosperms available as plantations in different ranges of the BR:

G. Angiosperms:

The BR represents Tropical Deciduous Forests including Tropical Moist Deciduous as well as Tropical Dry Deciduous type of vegetation. In all, 794 dicotyledonous species belonging to 448 genera and 106 families are reported from different localities of the BR by various authors. Most of

these are common but a few are rare in occurrence. A brief about their distribution, economic uses, status and the authorities reported them are summarized as hereunder.

Thus, a total of 1111 species of angiosperms belonging to 595 genera and 133 families are distributed in different ranges of Achanakmar-Amarkantak BR. Of these, 1 species viz. *Bothrichloa grahamii* (Haines) Bor is endemic to this region and 274 species are rare in occurrence. Besides this, there are 19 species are vulnerable, 8 endangered and 1 species is critically endangered (Fig. 2). The various kind of threat is generally due to over exploitation for their use in Ayurvedic medicines as well as due to habitat loss.

2. Faunal Resources: The faunal resources available in the BR are also very rich and varied from soil microbes, helping in decomposition of forest litter, to macrobes like various groups of arthropods (Shadangi and Nath, 2006), scavengers, phytophagous, omnivorous and carnivorous individuals. The identified fauna constitutes 5 species of centipedes, 48 species of butterflies, 36 species of moths, 26 species of beetles, 1 cricket species of orthopoda, 16 species of fishes, 10 species of amphibians, 15 species of reptiles, i.e. snakes and lizards, 142 species of birds and 27 species of mammals. The total number of identified fauna is 326. The BR shelters 55 globally threatened faunal species (categorized as per IUCN). The species reported from different localities of the BR by different authorities have been grouped as hereunder:

A. Arthropods:

Besides various groups of microarthropods (Shadangi and Nath, 2006), the chilopods or centipedes sampled from the different zones of Achanakmar- Amarkantak BR by Zoological Survey of India, Central Regional Station Jabalpur are identified as *Scolopendra moraltans* Linn. from Ataria, Chhaparwa; *Scolopendra amazonica* (Bucharl.), *Cormocephalus dentipes* (Pocock), *Cormocephalus pilosus* Jangl. and *Rhysida nuda nuda* (Newport) from Amarkantak (Khanna, 2006). All these centipedes were belonging to the family Scolopendridae.

Besides centipedes, variety of millipedes also moves in the sal forest during monsoon. But, no work is available on the millipedes existing in different ranges of the BR.

Studies on other arthropods like insects were also initiated by Zoological Survey of India, Central Regional Station Jabalpur, who identified 82 lepidopteran insects consisting of 48 species of butterflies belonging to 32 genera under 8 families and 34 species of moths belonging to 32 genera under 13 families. Besides this, 2 species of moths were identified by us during the present course of study. The butterflies are diurnal in habit. They visit the flowers and often help in pollination. Their larvae, called caterpillars, feed on the foliage of forest and agricultural crops. The various species identified from Achanakmar-Amarkantak BR are as hereunder:

*C= Common, Lc= Least Concern; VC= Very Common; NR= Near to Rare

Besides this, the following two species are insects were sampled and identified from the different localities of the BR. A brief description on each of them is as hereunder:

1. *Dichocrocis leptalis* Hampson (Lepidoptera: Pyralidae: Pyraustinae)

Length varies from 8 to 10 mm. Wing span varies from 18-24 mm. Bright ochreous, abdomen banded with brownish ochreous. FW with four medial sinuous lines from costal to inner margin. Two post medial black spots at costa on 2nd and 4th sinuous lines. A fine black marginal line is present in both the wings. HW with three sinuous lines. Sample deposited at TFRI under accession No.226. Distribution: Amarkantak. Host: seeds of *Shorea robusta*. Date of collection: 13.07.1998.

2. *Paectes (Ingura) subapicalis* Wlk. (Lepidoptera: Noctuidae: Euteliinae)

Length of male varies from 12-15 mm where as female is 15 mm. The wing span is 28-30 mm in male and 30-36 mm in female. Antennae in male are with very short branches on the outer side. Dark fuscous grayish brown moth with FW double dark antemedial line incurved below the cell and minute very indistinct orbicular and reniform spots, an obscure waved medial line, a double post medial line highly angled outwards beyond the cell and a chocolate patch beyond it on the costa; traces of a pale waved sub-marginal line along with a lunulate marginal line. HW with pale basal area. Abdomen with a long tubular anal tuft. Sample deposited at TFRI vide Accession No. 564. Distribution: Jagatpur, Kabirchabutara. Host: *Shorea robusta*. Date of collection: 17.06.1998.

Most of the species listed above are common to very common in status. The study needs further taxonomical work including their status because a large number of species like teak defoliator and skeletonizer, which are seen by the project leader, are missing from the reports published by Zoological Survey of India as well as by other investigators. Further, out of 128 species of butterflies listed under schedules as per Wildlife (Protection) Act, 1972 (Anon, 1992), the nymphalid, *Hypolimnas bolina* (Linn.) and *H. misippus* Linn., are common to least concern in status and *Charaxes fabius cerynthus* Fruhsstor, as a common species of Achanakmar- Amarkantak BR (Singh and Chandra, 2006). Its allied sub species *C. fabius sulphureus* Roth, which is naturally distributed in Assam, is rare in occurrence (Evans, 1932). It is protected by being kept under schedule II of the Wildlife Protection Act, 1972 (Anon., 1992). Similarly, *Phaedyma columella* (Cramer) is a common species recorded from Achanakmar (Singh and Chandra, 2006). Its subspecies *P. columella birghami*

(Frühstetter), which is naturally distributed in Andaman and Nicobar only, is critically endangered (CR) and included under schedule II of the Act. Among Papilionidae, *Chilasa clytia* (Linn.) is a common butterfly known from Achanakmar. Its allied *C. clytia clytia f. committus* Rothschild, which is naturally distributed in Meghalaya and Sikkim is endangered (EN) as per IUCN (Gupta and Mondal, 2005). *Euploea core core* (Cramer) (Family Danaidae) is very common in Achanakmar (Singh and Chandra, 2006). Its allied *E. core simulatrix* or *E. chimaera simulatrix* WM & DeN, which is distributed in south Nicobar Island and categorized as rare, is protected by placing under schedule II. Out of 3 species of Satyridae recorded from Achanakmar, *Mycalesis lepcha davisoni* Moore is common in its status (Singh and Chandra, 2006). However, its allied subspecies *M. lepcha betham* M., which is naturally distributed from Orissa to M.P. (Evans, 1932) and not reported by any authors. It is protected by being kept under schedule II (Anon., 1992).

Other group of insects consists of beetles. Zoological Survey of India and Tropical Forest Forest Research Institute, Jabalpur identified only 24 species of beetles as summarized in the following table from different localities of BR.

*C= Common, R= Rare

Entomologist from TFRI surveyed Jagatpur and identified following two more species of beetles.

1. *Lophosternus indicus* Hope: (Coleoptera: Cerambycidae: Prionini)

Chocolate brown with length varying from 25 to 50 mm. Head darker brown, coarsely punctured. Eyes rather narrow, upper lobe at a distance of at least half of its own width from the antennal tuber. Antennae in male is three-fourths to five-sixths of the length of the body whereas in female reaching to middle of elytra. First joint reaching to a short distance beyond the hind margin of the eye, third slightly dilated but not sharply angulate at the apex, fourth slightly acute at the apex. Fifth to tenth produced into an acute angular process at apex on the anterior side. Pronotum with 3 marginal spines, closely and finely punctured in front and for some distance back along each side of middle line, closely but more strongly punctured at the side. Hind angles more or less obtuse often rounded off. Elytra more or less rugulose and punctuate. Hind breast is bare of pubescence. Sample deposited at TFRI vide Accession No. 551. Distribution: Jagatpur. Date of collection: 28.06.1998.

2. *Macrotoma fisheri* Waterh. (Coleoptera: Cerambycidae: Prioninae: Macrotomini)

Length of the male is 46 mm and female varies from 60 to 66 mm. Antennae reddish brown either longer or shorter than body, usually aspirate or denticulate near the base, 11 jointed. Male antennae, first joint stout, somewhat compressed, third elongated and thickened. Female antennae shorter with first and third joints much less thickened and not aspirate. Basal three joints of antennae are nearly black. Front legs nearly black, the middle and hind legs and all the tarsi piceous. The elytra is yellowish brown and darker at the base. Hind breast clothed with fulvous yellow pubescence. Head

opaque, strongly and closely punctured in front, densely and finely granulose behind. Antennae reach to the apical third of the elytra. First joint rather stout, twice as long as broad, strongly but sparsely punctured, third thick, flattened or slightly channelled above and equal in length to fourth, fifth and half of the sixth. Prothorax with its lateral edges sharply spined converging in nearly straight lines towards the apex. Elytra parallel-sided, scarcely wider than base of the prothorax. Finely granulate near scutellum. Legs are somewhat spinous beneath. The front femora are very rough. Abdomen is slightly glossy. Sample deposited at TFRI vide Accession No. 553. Distribution: Jagatpur. Date of collection: 28.06.1998.

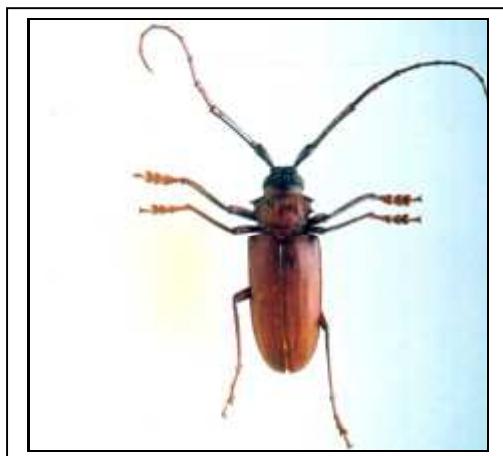

Fig 5. *Lophosternus indicus*

Fig 6. *Macrotoma fisheri*

Thus, there are 26 species of beetles belonging to 16 genera under two families of beetles. The gathered information from various sources still appears incomplete, due to lack of identity of many species of beetles belonging to the family Anthribidae, Bostrichidae, Cerambycidae, Chrysomelidae, Cantheridae, Scolytidae, Curculionidae, Coccinellidae, Elateridae, Platypodidae, etc.

A monster cricket *Schizodactylus monstrosus* (Drury) was also reported by Chandra and Gupta (2005) from Achanakmar. The species is rare in habit.

The information about other group of insect arthropods like bees, wasps, dragon and mayflies, mantids, grasshoppers, termites, flies and others like crustaceans, spiders and mites, etc. is still unexplored. Studies on mollusks existing in the BR are also untouched and provide ample scope for their taxonomical and ecological studies.

B. Vertebrate fauna:

Different classes of vertebrates known from the Achanakmar- Amarkantak BR are Pisces, amphibian, reptiles, aves and mammals. A brief about each of them is as hereunder:

Pisces:

These are fresh water inhabiting in running streams and ponds existing in core, buffer and transition zones of Achanakmar-Amarkantak BR. On the basis of published literature, there are 16 species of Pisces belonging to 13 genera under 8 families as detailed below:

-----	----------------------------------------------------	------------	-------	-----------------

*C= Common, LR-lc= Lower risk least concern, LR-nt=Lower risk near threatened, EN= Endangered, VU=Vulnerable

Out of 16 species of fishes, *Notopterus chitala* (Ham.-Buch), commonly known as chital or mohi, is silvery, dark along the back, and distributed in fresh water of Achanakmar- Amarkantak BR of Chhattisgarh. It is reported as endangered in the BR. Stinging catfish *Heteropneustes fossilis* (Bloch.), Olive carp *Puntius sarana sarana* (Ham.-Buch.), Catla *Catla catla* (Ham.-Buch.) and *Clarias batrachus* (Linnaeus) are vulnerable in their status and deserve for protection.

Amphibians:

These cold blooded vertebrates are insectivorous in habits. Zoological Survey of India, Jabalpur studied the amphibians existing in different localities of the BR. The distribution of different species and their status are summarized in the following table:

*C= Common, LR-lc= Lower risk least concern, LR-nt=Lower risk near threatened, EN= Endangered, VU=Vulnerable

The population of *Philautus sanctisilvaticus* Das and Chandra, is decreasing and it is categorized as “Critically Endangered” (CR) globally as per IUCN 2001. Leith’s Frog *Indiranana leithii* (Boulenger) and the Cricket frog *Limnonectes limnocharis* (Boie.) are the vulnerable species of amphibians reported from different localities of BR and need attention for the protection.

Reptiles:

Reptiles consisting of lizards and snakes are cold blooded animals. Most of them are insectivorous, excepting a few who feed on amphibians, reptiles, birds and mammals. The species reported from different areas of Achanakmar- Amarkantak BR and their status are summarized in the following table.

* C= Common, LR-nt= Low risk- near threatened, LR-lc= Low risk- least concern, VC= Very common, VU= Vulnerable

Bengal monitor *Varanus bengalensis* (Linnaeus) is a vulnerable species whereas the rock python *Python molurus molurus* (Linnaeus) is in Lower risk near threatened category as per IUCN 2002. Common Krait *Bungarus caeruleus* (Schneider), Buf- striped keel back *Amphiesma stolata* (Linnaeus) and Rat snake *Ptyas mucosus mucosus* (Linnaeus) are reported as Lower risk near threatened (LR-nt) by some authors (Chandra and Pandey, 2005, Chandra, 2006 b). The species of snakes like Branded Krait *Bungarus multicinctus* Blyth and the Cobra *Naja naja* (Linn.) are not reported by any authors, though, they are seen during monsoon. Thus, further exploration on this line is also required.

Aves:

Aves or birds are warm blooded vertebrates. Feathers on the body assist birds in maintaining an even temperature. They are able to withstand great extremes of climate. In all, 142 species of birds belonging to 52 families are known from different localities of Achanakmar- Amarkantak BR (Chandra, 2006 b). Most of these birds are common in their status and protected by being placed in schedules as per Wildlife (Protection) Act 1972 (Anon, 1992). A few species existing in the BR are categorized globally as Critically Endangered (CR) like the Asian White-backed Vulture *Gyps* (*Paeudogyps*) *bengalensis* (Gmelin); Vulnerable (VU) like the Saras Crane *Grus (Antigone) antigone* (Linnaeus), Lower Risk –near threatened (LR-nt) like *Aythya nyroca* (Guldenstadt), *Torgos* (*Sarcogyps*) *calvus* (Scopoli) and *Esacus magnirostris recurvirostris* (Cuvier) as per IUCN categorization 2002.

Though, the BR is very rich in avifauna, still, there is a controversy on the number of species of birds existing in Achanakmar- Amarkantak BR. Rao and Bhatnagar (2007) reported the existence of 176 species of birds in the BR. Thus, it also provides ample scope for further study.

Mammals: Among mammals, eutherians are highly evolved, perfectly warm blooded animals. In Achanakmar- Amarkantak BR, following 27 species of mammals are distributed in different ranges.

Table 15. Different species of mammals reported from Achanakmar-Amarkantak BR

EN=Endangered, LR-lc=Lower risk least concerned, LR-nt= Low risk near threatened, VU= Vulnerable.

Most of the above species are of low risk (LR) either not threatened (-nt) or least concern (-lc) excepting a few species like the tiger *Panthera tigris* (Linnaeus), which is categorized as Endangered (EN) and the bison *Bos gaurus gaurus* Smith, wild dog *Cuon alpinus* (Pallas), sloth bear, *Melursus ursinus* (Shaw) and four horned antelope *Tetracerus quadricornis* (Blainville) as Vulnerable (VU) as per IUCN 1994 and 2002. Bison *Bos gaurus gaurus* Smith, Indian Wolf *Canis lupus pallipes* Sykes, panther or leopard *Panthera pardus fusca* (Meyer), tiger *Panthera tigris* (Linnaeus) and the Sloth bear *Melursus ursinus* (Shaw) have been protected by listing under schedule I of the Wildlife Protection Act 1972 (Anon., 1992). Thus, the BR is very rich in Biodiversity varying the category of mammals from “Lower risk” to “Endangered” species.

Threatened fauna:

Out of nearly 89,317 species of animals described from India (Alfred, 1998), 366 taxa consisting of 148 species of mammals, 138 species of birds, 32 species of reptiles, 3 species of amphibians, 17 species of fishes and 28 species of invertebrates (12 species of insects, 10 species of crustaceans and 6 species of mollusks) are categorized as “threatened” by IUCN (2002). In Achanakmar- Amarkantak BR, there are 55 threatened species of animals reported by different authorities from Lower risk- least concern to critically endanger.

II. Other Data Collected:

Land use history:

The core area of Achanakmar-Amarkantak BR was declared as a Reserve Forest in 1878 by notification No. 5037 dated 7th Dec. 1878 under Section 34 of the Indian Forest Act VII. Later on, it was given under the *Zamindari* system to Pendra *Zamindar* (Landowner). In 1912, Government of India advised the *Zamindar* to introduce the fire protection measures and removal of climbers and regularisation of Nistar (Pandit, 1971), but he failed to follow the instructions. The area was cut and burnt and system of shifting cultivation, locally

Fig 8. Siawal sagar lake

known as ‘*podu*’ or ‘*bewar*’, was practised by the *baiga* and other tribal inhabitants especially on the steep slopes of Maikal range. In this practice, the sal forests were cleared and cultivated for 2-3 years by tribal and then abandoned after their shifting to another area. This practice had lasting effect on vegetation cover or composition giving rise to mixed species with poor regeneration. Later on, a working scheme was introduced by Government in the area to preserve the forest cover and improve its depletion. The practice was then restricted to a limited area.

In 1928, Mr. C.M. Wilfer prepared a working plan of Pendra *Zamindari* (Pandit, 1971). In the initial years Pendra *Zamindar* followed some of the prescriptions and a large number of irregular felling of tree were done through contractors led to heavy irregular over exploitation. This tradition of felling was continued up to 1951. To check the deterioration, Government decided to take over the management of these forests by abolition of proprietary rights in the state, and transferring them to the forest department vide notification no. 28 of CR/299 XII dated 07-05-51. After abolishing the proprietary rights, the Government of Madhya Pradesh declared it as Protected Forest under adhoc notification No. 233-X and 9-X-59 dated 9-3-1957 and 10-7-1958 respectively. Minor alteration of afforestation and deforestation occurred in later years. The forests of BR were notified under section 241 of the Madhya Pradesh Land Revenue code 1959 vide Govt. of M.P. notification no. 7102/6006/VII dated 27-12-63 and no. 7/06/7-C/2 dated 03-09-64. These were the special significance for the protection and control of the Government forests in the tract. The area was surveyed some times during 1955 to 1963. Considering sufficient number of wildlife, the M.P. Government under the provision of section 66(4) of the wildlife protection Act 1972 declared the area as Achanakmar Game Sanctuary vide notification no. 2649-966-10-2-75 dated 28th June 1975. Later on, the Government of M.P. declared the present core area of the BR as reserve forest under Indian Forest Act Sec 34 vide notification no. 5037 dated 07/12/1978. After enforcement of Wildlife Protection Act, all the forestry works including collection of NTFPs were stopped by Government. However, to improve the degraded compartments a few teak plantations were done between the years 1952 to 1978.

Cultural Heritage:

The sub urban township Amarkantak, situated in the buffer zone of the BR, is of great cultural and religious significance for Hindus, Jains and Sikhs. It is the origin place of the holy Narmada river, the Sone river and the Johilla river. It is said that Adi Sankaracharya, who was born in 788 AD, consecrated on the bank of the river Narmada at Amarkantak. He founded Pataleshwar Mahadev at the origin of river Narmada. This place was later named as Surajkund. Kalchuri Maharaja Karna Dev (1042-1072 AD) constructed temple at Surajkund. An open pool has been constructed at the origin of the Narmada river, which is known as Narmadakund. A number of temples such as Narmada temple, Shiva temple, Shri Shuryanarayan temple, Durga temple, etc. surround the Narmadakund. The ancient temples of Kalchuri period, Machhendranath and Pataleshwar are excellent examples of architecture. It is said that Gods, *Gandharvas*, *Asuras* (demons), saints and sages achieved their spiritual powers at Amarkantak. Kapil Muni, Bhrigu Rishi and Markandeya Rishi had

their *ashrams* here. Devotees from different states come throughout the year to visit the temples and *ashrams*.

Landscape features that attract visitors:

Amarkantak plateau, Lamni and Achanakmar forest ranges, many permanent and seasonal waterfalls like Durgadhara, Shambhudhara, Kapildhara (Fig. 7), Mendri Sarai fall and water reservoirs like Sinhwal-sagar lake (Fig. 8) beautify the area and have scenic spots. The cool, calm, dense sal forest with a variety of wild fauna, also attract the tourists. A number of tourists visit the core and buffer zones of BR for enjoying its wilderness and wildlife. The trend of number of tourists visiting Achanakmar and Lamni has continuously increased in the recent years. Students from nearby universities, researchers from various research organisations of the country often come for various studies related to floral and faunal taxonomy, ecology, animal behaviour, etc.

Rural inhabitants and their population:

Most of the rural inhabitants in the BR are primitive forest dwelling tribe. In urban towns, however, several other castes also live together with the tribal. There are 27 communities namely- Baiga, Gond, Dhanwar, Kol, Kanwar, Oraon, Chamar, Sais (Sarthi), Basore, Lonia, Muslim, Sindhi, Brahmin, Rajpur, Goswami, Baraith, Kalar, Kumhar, Kewat, Nai, Ahir (Raut), Panika, Sondhiya, Lohar, Maratha, Sonar and Baniya live in different zones of the BR. The baiga are dominant in population. There are 22 villages in the core region with a population of 7,617 traditional primitive tribes as per 2001 census. In buffer and transition zone, there are 396 villages and suburban areas with a population of 4,40,404 inhabitants of nearly 27 communities. The tribal population residing in the BR consists of 56.11%. The scheduled caste population is 6.9 %. The literacy rate is only 26.48 %. The socio-economic status of inhabitants in different villages and sub urban areas also studied. It was observed that the inhabitants are poor and depend mainly on agriculture and partially on BR for fuel, fodder, food, medicine, etc. About 8232.47 tonnes of 47 items of NTFPs with a total value of more than 2.70 crores are collected by local tribal from Amarkantak plateau (Tiwari *et al.*, 2000).

Human impact:

The inhabitants depend mainly on the agriculture which is based on the rains. They cut bamboos and make bamboo items and fuel wood besides collection of non timber forest produce including food and medicinal plants from the BR. Cattle are less productive and cattle grazing cause a loss to mainly buffer and transition zones of the BR. Human-wildlife making animals in the BR are the snakes, small mammals like wild boar, large carnivores like leopard, tiger, sloth bear, etc. Marwahi Forest Division of the BR is well known for human-sloth bear conflict (Akhtar and Chauhan, 2007). The maximum incidences due to mauling are reported to be caused by sloth bear followed by Jackals, leopards, hyena and wild boar. The reason is probably due to degradation of forest areas, fragmented and interspersed agricultural fields.

Tourism:

Majority of the tourists come for site seeing (Fig. 9) in the BR besides the devotees who come to worship the temples, holy river Narmada and Sone. The scenic spots are Durgadhara, Kabirchabutra, Sambhudhara, Kapildhara (Fig. 7), Sinhwal Sagar Lake (Fig. 8), Rakshasakh water fall (Fig. 10), etc. Tourists also visit to study flora, fauna and other natural heritage sites, caves, etc.

III. Dissemination of information:

- To disseminate the collected research based information, 2 issues of Biosphere Reserve Information Series (BRIS) published and distributed to managers of all BRs of the country.
- Compendium of Achanakmar-Amarkantak BR prepared and information disseminated to BR managers.
- Electronic form of BRIS issues provided to BR managers of Achanakmar-Amarkantak BR.

IV. Interactions:

- Frequent interactions were made with BR managers from time to time to work out the needs of Achanakmar-Amarkantak BR. A workshop was also held in April, 2007 to find out the research needs. In all, 8 basic research needs or gaps were identified. The proceeding of the workshop published in September 2007, was distributed to BR authorities.
- Interacted with academicians and scientists working on BRs and discussed on various issues pertaining to the BR. They were motivated to submit the research projects on various issues to MOEF for funding. In all, scientists of following 10 research institutes/ universities/ NGO's Viz. State Forest Research Institute, Jabalpur, Zoological Survey of India, Jabalpur, A.P.S. University, Rewa, G.G. University, Bilaspur (Chhattisgarh), I.G.K.V.V. Raipur (Chhattisgarh), Anthropological Survey of India, Nagpur, Botanical Survey of India, Allahabad, National Botanical Research Institute, Lucknow (Uttar Pradesh), Tropical Forest Research Institute, Jabalpur and Wildlife Institute of India, Dehradun were consulted.

V. Other assignments:

- State Level Steering Committee meetings held at Raipur were attended every year.
- Madrid Action plan prepared and submitted to funding agency.
- Biosphere Reserve nomination report drafted and submitted to Principal Chief Conservator of Forests and Chief Wild Life Warden, Chhattisgarh for suggestions on 13th March 2009. PI visited personally to discuss on the issue.

11. Conclusion

- Achanakmar- Amarkantak BR is spread over an area of 3835.51 sq km. It represents the Deccan Peninsular biogeographic zone of India. Its topography varies from plains of Bilaspur district to hilly terrains and valleys. About 4,48,021 inhabitants, mainly tribes live in 418 small to large villages and sub urban areas.
- The core area was declared as a Reserve Forest in 1878. Later, it was given under the *Zamindari* system. In 1928, Mr. C.M. Wilfer prepared a working plan. Due to heavy irregular over exploitation, Government decided to take over the management of these forests by abolition of proprietary rights.

It was declared as Protected Forests in 1958. Considering sufficient number of wildlife, it was declared as Achanakmar Game Sanctuary in 1975. Later, it was declared as core area of the BR.

- The vegetation is tropical deciduous type and is classified into Northern Moist Deciduous to Southern Dry Mixed Deciduous forests. The forest area is about 63.91 % of total geographical area.
- The BR is blessed with a total of 1498 identified floral species consisting of 7 algae species, 178 fungi, 130 species of lichens, 16 bryophyte species, 40 pteridophyte species, 16 gymnosperms species and 1111 angiosperms species. Besides this, there are 117 identified invertebrates including variety of beautiful butterflies, moths, beetles, cricket, centipedes and 210 species of identified vertebrates consisting of mammals, birds, reptiles, amphibians and fishes, which enhance the beauty of the BR.
- The inhabitants are poor and depend mainly on agriculture and partially on BR for fuel, fodder, food and medicine, etc.
- Research projects are continued on various aspects of Achanakmar-Amarkantak BR. Hence, regular collection of scientific information and then disseminate it to BR managers to incorporate in management plan, is essential need of the hour. The present system should continue in the near future also.

12. Publications:

- Besides, compendium on Achanakmar- Amarkantak BR, 2 issues of Biosphere Reserve Information Series (BRIS) published.
- A proceeding of Workshop on Research Needs for Achanakmar- Amarkantak Biosphere Reserve published.

13. Suggestions for follow-up study:

The gathered information from various sources still appears incomplete, due to lack of identity of many species of beetles belonging to the family Anthribidae, Bostrichidae, Cerambycidae, Chrysomelidae, Cantheridae, Scolytidae, Curculionidae, Coccinellidae, Elateridae, Platypodidae, etc. The information about other group of insect arthropods like bees, wasps, dragon and mayflies, mantids, termites, flies and others like crustaceans, spiders and mites, etc. is still unexplored. Though, these groups of insects are plenty in number. Zoological Survey of India, Jabalpur has identified only one species of Cricket *Schizodactylus monstrosus* (Drury), though a lot of species of grasshopper and cricket were seen jumping on sal forests during the course of project period. Similarly, a large number of mollusk shells have been observed on sal trees and near water sources in BR. Studies on mollusks existing in BR are also untouched and provide ample scope for their taxonomical and ecological studies.

The population of *Philautus sanctisylvaticus* Das and Chandra, is decreasing and it is categorized as "Critically Endangered" (CR) as per IUCN 2001. Leith's Frog *Indiranachitra leithii* (Boulenger) and the Cricket frog *Limnonectes limnocharis* (Boie.) are the vulnerable species of amphibians reported from different localities of BR and need attention for the protection. The species of snakes like Branded Krait *Bungarus multicinctus* Blyth and the Cobra *Naja naja* (Linn.) are not reported by the authors, though, they are seen during monsoon. Similarly, the BR is also very rich in avifauna. There is a

controversy on the number of species of birds existing in Achanakmar- Amarkantak BR. Rao and Bhatnagar (2007) reported the existence of 176 species of birds in this BR. Thus, it provides ample scope for further study.

Flying squirrel has been seen in Lamni range of the BR, but it has not been reported by any author. Similarly, insectivores like Mole shrew, Musk shrew and Hedgehog, etc. and chiropterans are not reported so far from the various localities of BR. Therefore, there is a scope to explore further on mammals existing in the BR.

14. Summary of the project

Achanakmar-Amarkantak BR is spread over an area of 3835.51 sq. km. in Chhattisgarh and Madhya Pradesh states of Indian Union. It represents the Deccan Peninsular biogeographic zone of India. Most of the area of BR is dense, open, degraded and blank forest with rich biodiversity alongwith agriculture fields in between. The BR supports three major river systems, viz. Narmada river and its tributaries, Sone river and its tributaries and Johilla and its tributaries, besides many seasonal and permanent streams, rivulets, etc. The topography varies from plain rice fields in Bilaspur and Anuppur and wheat fields in Dindori district to the hills of Maikal ranges of Satpura. The topography in combination with perennial streams and valleys has created micro-climate conditions in the area to provide diverse environmental conditions, encouraging luxuriant growth for several species of flora and fauna of economic value.

The core zone of the BR is protected dense forest area of 551.55 sq. km. It is the area that supports the majority of the biodiversity. The core zone is surrounded by buffer and the outermost transition zones of about 3283.96 sq. kms.

The forest vegetation in the BR is Tropical Deciduous type and is classified into Northern Tropical Moist Deciduous and Southern Dry Mixed Deciduous Forests. Forest constitutes about 63.91% of the total geographical area of the BR. In all, 1498 identified species of flora consisting of 7 algal species, 178 fungi, 130 species of lichen, 16 species of bryophytes, 40 pterodophytes, 16 species of gymnosperms and 1111 species of angiosperms. Nearly 51 species of angiosperms and 7 species of pterodophytes, natural growing or cultivated in BR, have great demand for preparation of Ayurvedic medicines. Besides this, 3 species of flora are endemic, 282 species are rare and 39 species are threatened due to over exploitation and habitat loss.

The faunal resources are also very rich and varied from soil microbes to arthropods, scavengers, phytophagous, omnivorous and carnivorous species. About 117 identified species of invertebrates including variety of beautiful butterflies, moths, beetles, centipedes and 210 identified species of vertebrates including beautiful mammals, birds, reptiles, amphibians and fishes enhance the beauty of the BR. Out of 327 identified species of fauna in different ranges of BR, about 17 % species are regionally threatened to various categories. Human-wildlife conflict caused by snakes, wild boar, leopard, sloth bear, etc. is often reported from different ranges of the BR. the maximum incidences are due to sloth bear followed by jackals, leopards, hyena and wild boar. The reason is probably due to degradation of forest areas, fragmented and interspersed agricultural fields.

Nearly, 7,617 traditional primitive tribal inhabitants ar per the population census of the year 2001 are settled in 22 villages of the core zone whereas 4,40,404 inhabitants live in 396 villages and suburban areas of buffer and transition zones of the BR. There are 27 communities living in different zones. These are Baiga, Dhanwar, Kol, Kanwar, Oraon, Chamar, Sais, Basora, Lonia, Muslim, Sindhi, Brahmin, Rajput, Goswami, Baraith, Kolar, Kumhar, Kewat, Nai, Ahir, Panika, Sondhiya, Lohar,

Maratha, Sonar and Bania. The inhabitants are poor and depend mainly on agriculture and partially on BR for fuel, fodder, food, medicine, etc.
